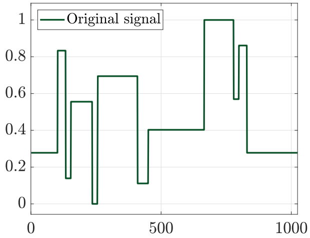
Reconstruction of a piecewise noisy signal

Ground truth

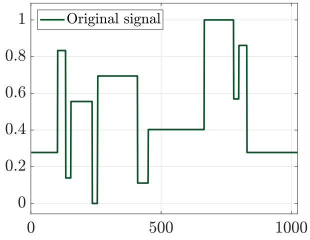
$$\overline{x} \in \mathbb{R}^N$$



Reconstruction of a piecewise noisy signal

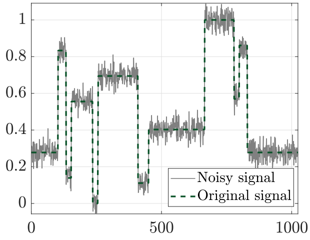
Ground truth

$$\overline{x} \in \mathbb{R}^N$$



Gaussian noise with $\sigma = 0.04$

$$y = \overline{x} + \xi \in \mathbb{R}^N$$



Purpose: recover the true signal <u>with *sharp* transitions</u>

Denoising by functional minimization

Regularized scheme — **D**: *differential operator*, $\|\cdot\|_p$: ℓ_p-*norm*

$$\widehat{x}_\lambda \in \operatorname*{Argmin}_{x \in \mathbb{R}^N} \frac{1}{2}\|x - y\|_2^2 + \lambda \|\mathbf{D}x\|_p^p$$

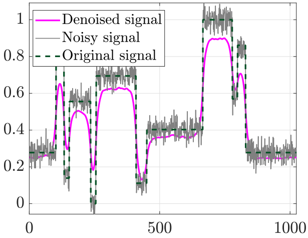
Denoising by functional minimization

Regularized scheme — $\mathbf{D}$: *differential operator*, $\|\cdot\|_p$: ℓ_p*-norm*

$$\widehat{x}_\lambda \in \underset{x \in \mathbb{R}^N}{\mathrm{Argmin}}\ \frac{1}{2}\|x-y\|_2^2 + \lambda\|\mathbf{D}x\|_p^p$$

Tikhonov regularizer $\|\mathbf{D}x\|_2^2$

Smooth: gradient descent



✗ fuzzy transitions

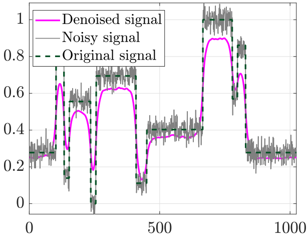
Denoising by functional minimization

Regularized scheme **D**: *differential operator*, $\|\cdot\|_p$: *ℓ_p-norm*

$$\widehat{x}_\lambda \in \underset{x\in\mathbb{R}^N}{\operatorname{Argmin}} \; \frac{1}{2}\|x-y\|_2^2 + \lambda\|\mathbf{D}x\|_p^p$$

Tikhonov regularizer $\|\mathbf{D}x\|_2^2$

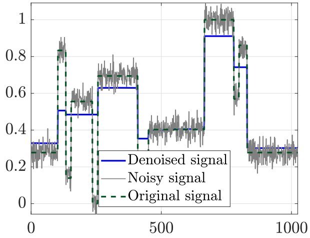
Smooth: gradient descent



✗ fuzzy transitions

Total Variation $\|\mathbf{D}x\|_1$

Nonsmooth: proximal algorithm



✓ sharp transitions

Formulation of the problem

Piecewise denoising

$$\widehat{x}_\lambda \in \operatorname*{Argmin}_{x \in \mathbb{R}^N} \frac{1}{2}\|x - y\|_2^2 + \lambda \|\mathbf{D}x\|_1$$

Formulation of the problem

Piecewise denoising

$$\widehat{x}_\lambda \in \operatorname*{Argmin}_{x \in \mathbb{R}^N} \frac{1}{2}\|x - y\|_2^2 + \lambda \|\mathbf{D}x\|_1$$

- *Smooth* data-fidelity $\qquad f(x) = \dfrac{1}{2}\|x - y\|_2^2$

Formulation of the problem

Piecewise denoising

$$\widehat{x}_\lambda \in \underset{x \in \mathbb{R}^N}{\mathrm{Argmin}} \ \frac{1}{2}\|x - y\|_2^2 + \lambda \|\mathbf{D}x\|_1$$

- *Smooth* data-fidelity $\quad f(x) = \frac{1}{2}\|x - y\|_2^2$
- *Non-smooth* regularizer $\quad h(\mathbf{L}x) = \lambda\|\mathbf{D}x\|_1, \quad$ with $h(z) = \lambda\|z\|_1$

Formulation of the problem

Piecewise denoising

$$\widehat{x}_\lambda \in \operatorname*{Argmin}_{x \in \mathbb{R}^N} \frac{1}{2}\|x-y\|_2^2 + \lambda\|\mathbf{D}x\|_1$$

- *Smooth* data-fidelity $\quad f(x) = \frac{1}{2}\|x-y\|_2^2$
- *Non-smooth* regularizer $\quad h(\mathbf{L}x) = \lambda\|\mathbf{D}x\|_1, \quad$ with $h(z) = \lambda\|z\|_1$

General form:

$$\widehat{x} \in \operatorname*{Argmin}_{x \in \mathbb{R}^N} \{f(x) + h(\mathbf{L}x) = f(x) + g(x)\}$$

f *smooth*; h and $g = h(\mathbf{L}\cdot)$ *nonsmooth*.

Optimization algorithm: *Forward-Backward*

Let $\mathcal{H}$ be a Hilbert space.
Let $f \in \Gamma_0(\mathcal{H})$ be differentiable with a ν-Lipschitzian gradient where $\nu \in \,]0,+\infty[$.
Let $g \in \Gamma_0(\mathcal{H})$.

Let $\gamma \in]0, 2/\nu[$ and $\delta = \min\{1, 1/(\nu\gamma)\} + 1/2$.
Let $(\lambda_n)_{n\in\mathbb{N}}$ be a sequence in $[0,\delta[$ such that $\sum_{n\in\mathbb{N}} \lambda_n(\delta - \lambda_n) = +\infty$.

Assume that $\mathrm{Argmin}(f+g) \neq \varnothing$. Let $x_0 \in \mathcal{H}$ and

$$(\forall n \in \mathbb{N}) \qquad \begin{cases} y_n = x_n - \gamma \nabla f(x_n) \\ x_{n+1} = x_n + \lambda_n(\mathrm{prox}_{\gamma g} y_n - x_n). \end{cases}$$

Then, $(x_n)_{n\in\mathbb{N}}$ converges weakly to a minimizer of $f+g$.

Example: bounded least-squares

Observation model:

$$y = \mathbf{A}\overline{x} + \xi \in \mathbb{R}^P,$$

linear operator $\mathbf{A} \in \mathbb{R}^{P\times N}$, ξ Gaussian noise, ground truth $\overline{x} \in \mathbb{R}^N$, s.t.

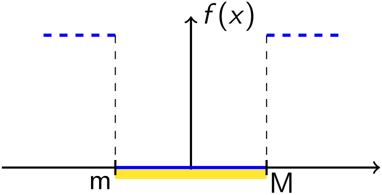
$$\forall i \in \{1, \dots, N\}, \quad m \leq \overline{x}_i \leq M$$

Bounded least-squares

$$C = \left\{x \in \mathbb{R}^N \,|\, \forall i, \;\; x_i \in [m, M]\right\}$$

$$\widehat{x} \in \underset{x \in C}{\mathrm{Argmin}} \; \frac{1}{2}\|y - \mathbf{A}x\|_2^2$$

$$\iff \quad \widehat{x} \in \underset{x \in \mathbb{R}^N}{\mathrm{Argmin}} \; \frac{1}{2}\|y - \mathbf{A}x\|_2^2 + \iota_C(x)$$



Optimization algorithm: projected gradient

Let $\mathcal{H}$ be a Hilbert space.
Let $f \in \Gamma_0(\mathcal{H})$ be differentiable with a ν-Lipschitzian gradient where $\nu \in \,]0,+\infty[$.
Let C a nonempty closed convex subset of $\mathcal{H}$ and P_C the projection on C.

Let $\gamma \in]0, 2/\nu[$ and $\delta = \min\{1, 1/(\nu\gamma)\} + 1/2$.
Let $(\lambda_n)_{n\in\mathbb{N}}$ be a sequence in $[0, \delta[$ such that $\sum_{n\in\mathbb{N}} \lambda_n(\delta - \lambda_n) = +\infty$.

Assume that $\operatorname{Argmin}_{x\in C} g(x) \neq \varnothing$. Let $x_0 \in \mathcal{H}$ and

$$(\forall n \in \mathbb{N}) \qquad \begin{cases} y_n = x_n - \gamma \nabla f(x_n) \\ x_{n+1} = x_n + \lambda_n(P_C y_n - x_n). \end{cases}$$

Then, $(x_n)_{n\in\mathbb{N}}$ converges weakly to a minimizer of g over C.

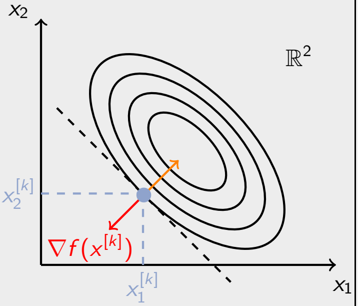
Optimization algorithm: gradient descent

Let $\mathcal{H}$ be a Hilbert space.
Let $f \in \Gamma_0(\mathcal{H})$ differentiable with a ν-Lipschitz gradient, $\nu \in \,]0, +\infty[$.

Le $\gamma \in]0, 2/\nu[$.

Assume that $\text{Argmin}\, f \neq \varnothing$. Let $x_0 \in \mathcal{H}$ and

$$(\forall n \in \mathbb{N}) \qquad x_{n+1} = x_n - \gamma \nabla f(x_n)$$



Then, $(x_n)_{n\in\mathbb{N}}$ converges weakly to a minimizer of f.

Optimization algorithm: Douglas-Rachford

Let $\mathcal{H}$ be a Hilbert space.

Let $f \in \Gamma_0(\mathcal{H})$ and $g \in \Gamma_0(\mathcal{H})$.

$$(\forall n \in \mathbb{N}) \qquad \begin{cases} y_n = \operatorname{prox}_{\gamma g} x_n \\ z_n = \operatorname{prox}_{\gamma f}(2y_n - x_n) \\ x_{n+1} = x_n + \lambda_n(z_n - y_n). \end{cases}$$

Optimization algorithm: Douglas-Rachford

Let $\mathcal{H}$ be a Hilbert space.

Let $f \in \Gamma_0(\mathcal{H})$ and $g \in \Gamma_0(\mathcal{H})$.

Let $\gamma \in \,]0, +\infty[$ and let $(\lambda_n)_{n \in \mathbb{N}}$ a sequence in $[0, 2]$ s.t. $\sum_{n \in \mathbb{N}} \lambda_n(2 - \lambda_n) = +\infty$.

Assume that $\operatorname{Argmin}(f + g) \neq \varnothing$. Let $x_0 \in \mathcal{H}$ and

$$(\forall n \in \mathbb{N}) \qquad \begin{cases} y_n = \operatorname{prox}_{\gamma g} x_n \\ z_n = \operatorname{prox}_{\gamma f}(2y_n - x_n) \\ x_{n+1} = x_n + \lambda_n(z_n - y_n). \end{cases}$$

The following properties are satisfied:

- $x_n \rightharpoonup \widehat{x}$
- $z_n - y_n \to 0$, $y_n \rightharpoonup \widehat{y}$, $z_n \rightharpoonup \widehat{y}$ where $\widehat{y} = \operatorname{prox}_{\gamma g} \widehat{x} \in \operatorname{Argmin}(f + g)$.

Optimization algorithm: Douglas-Rachford

Let $\mathcal{H}$ and $\mathcal{G}$ be two finite dimensional Hilbert spaces.
Let $g \in \Gamma_0(\mathcal{H})$ and $L \in \mathcal{B}(\mathcal{G}, \mathcal{H})$ s.t. L^*L is a isomorphism.

Let $\gamma \in \,]0, +\infty[$ and let $(\lambda_n)_{n\in\mathbb{N}}$ a sequence in $[0,2]$ such that $\sum_{n\in\mathbb{N}} \lambda_n(2-\lambda_n) = +\infty$.

Assume that $\mathrm{Argmin}(g \circ L) \neq \varnothing$. Let $x_0 \in \mathcal{H}$, $v_0 = (L^*L)^{-1}L^*x_0$ et

$$(\forall n \in \mathbb{N}) \qquad \begin{cases} y_n = \mathrm{prox}_{\gamma g} x_n \\ c_n = (L^*L)^{-1}L^*y_n \\ x_{n+1} = x_n + \lambda_n\big(L(2c_n - v_n) - y_n\big) \\ v_{n+1} = v_n + \lambda_n(c_n - v_n). \end{cases}$$

We have then $v_n \rightharpoonup \widehat{v}$ where $\widehat{v} \in \mathrm{Argmin}(g \circ L)$.

Optimization algorithm: Douglas-Rachford

Sketch of proof:

$$\underset{v \in \mathcal{G}}{\text{minimize}} \; g(Lv) \quad \Leftrightarrow \quad \underset{x \in \mathcal{H}}{\text{minimize}} \; \iota_E(x) + g(x)$$

where $E = \operatorname{ran} L$.
We apply Douglas-Rachford algorithm with
$f = \iota_E \Rightarrow \operatorname{prox}_{\gamma f} = P_E$ by setting

$$(\forall n \in \mathbb{N}) \qquad P_E y_n = L c_n \;\text{ and }\; P_E x_n = L v_n$$

where $c_n = \underset{c \in \mathcal{H}}{\operatorname{argmin}} \; \|y_n - Lc\|^2 = (L^* L)^{-1} L^* y_n$.

Optimization algorithm: Douglas-Rachford

Particular case of Douglas-Rachford algorithm:

$\mathcal{H} = \mathcal{H}_1 \times \cdots \mathcal{H}_m$ where $\mathcal{H}_1, \ldots, \mathcal{H}_m$ Hilbert spaces

$\big(\forall x = (x_1, \ldots, x_m) \in \mathcal{H}\big)\ g(x) = \sum_{i=1}^m g_i(x_i)$

where $(\forall i \in \{1, \ldots, m\}\ g_i \in \Gamma_0(\mathcal{H}_i)$

$L\colon v \mapsto (L_1 v, \ldots, L_m v)$ where $(\forall i \in \{1, \ldots, m\})\ L_i \in \mathcal{B}(\mathcal{G}, \mathcal{H}_i)$.

PPXA+ algorithm

Let $(x_{0,i})_{1\le i\le m} \in \mathcal{H}$, $v_0 = (\sum_{i=1}^m L_i^* L_i)^{-1} \sum_{i=1}^m L_i^* x_{0,i}$ and

$$(\forall n \in \mathbb{N}) \quad \begin{cases} y_{n,i} = \mathrm{prox}_{\gamma g_i} x_{n,i}, \quad i \in \{1, \ldots, m\} \\ c_n = (\sum_{i=1}^m L_i^* L_i)^{-1} \sum_{i=1}^m L_i^* y_{n,i} \\ x_{n+1,i} = x_{n,i} + \lambda_n \big(L_i(2c_n - v_n) - y_{n,i}\big), \quad i \in \{1, \ldots, m\} \\ v_{n+1} = v_n + \lambda_n (c_n - v_n). \end{cases}$$

We have then $v_n \rightharpoonup \widehat{v} \in \mathrm{Argmin} \sum_{i=1}^m g_i \circ L_i$.

Optimization algorithm: Douglas-Rachford

Particular case of Douglas-Rachford algorithm:

$\mathcal{H} = \mathcal{H}_1 \times \cdots \mathcal{H}_m$ where $\mathcal{H}_1 = \ldots = \mathcal{H}_m$ Hilbert spaces

$\big(\forall x = (x_1, \ldots, x_m) \in \mathcal{H}\big)\ g(x) = \sum_{i=1}^m g_i(x_i)$

where $(\forall i \in \{1, \ldots, m\}\ g_i \in \Gamma_0(\mathcal{H}_i)$

$L\colon v \mapsto (L_1 v, \ldots, L_m v)$ where $L_1 = \ldots = L_m = \mathrm{Id}.$

PPXA algorithm

Let $(x_{0,i})_{1 \le i \le m} \in \mathcal{H}$, $v_0 = \frac{1}{m}\sum_{i=1}^m x_{0,i}$ and

$$(\forall n \in \mathbb{N}) \qquad \begin{cases} y_{n,i} = \mathrm{prox}_{\gamma g_i} x_{n,i}, \quad i \in \{1, \ldots, m\} \\ c_n = \frac{1}{m}\sum_{i=1}^m y_{n,i} \\ x_{n+1,i} = x_{n,i} + \lambda_n\big(2c_n - v_n - y_{n,i}\big), \quad i \in \{1, \ldots, m\} \\ v_{n+1} = v_n + \lambda_n(c_n - v_n). \end{cases}$$

We have then $v_n \rightharpoonup \widehat{v} \in \mathrm{Argmin} \sum_{i=1}^m g_i$.
