Gradient descent in dimension N

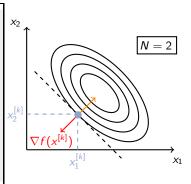

Gradient descent

Let $f:\mathbb{R}^N\to\mathbb{R}$ be convex, continuously differentiable on \mathbb{R}^N and with a β -Lipschitz gradient.

Let $x_0 \in \mathbb{R}^N$ and $\gamma_n \in]0, 2/\beta[$

$$(\forall n \in \mathbb{N}) \quad x_{n+1} = x_n - \gamma_n \nabla f(x_n).$$

 $(x_n)_{n\in\mathbb{N}}$ converges to a minimizer of f.

 β -Lipschitz gradient Let $f: \mathbb{R}^N \to \mathbb{R}$ be convex, continuously differentiable on \mathbb{R}^N . f is gradient β -Lipschitz with $\beta > 0$ if

$$(\forall (u, v) \in \mathbb{R}^N \times \mathbb{R}^N) \quad \|\nabla f(u) - \nabla f(v)\| \le \beta \|u - v\|$$

Gradient descent in dimension N

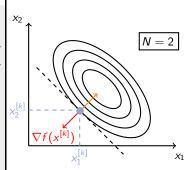

Gradient descent

Let $f: \mathbb{R}^N \to \mathbb{R}$ be convex, continuously differentiable on \mathbb{R}^N and with a β -Lipschitz gradient.

Let $x_0 \in \mathbb{R}^N$ and $\gamma_n \in]0, 2/\beta[$

$$(\forall n \in \mathbb{N}) \quad x_{n+1} = x_n - \gamma_n \nabla f(x_n).$$

 $(x_n)_{n\in\mathbb{N}}$ converges to a minimizer of f.

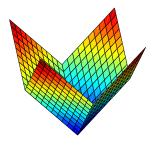

lterative method: build a sequence $(x_n)_{n\in\mathbb{N}}$ s.t., at each iteration n

$$f(x_{n+1}) < f(x_n)$$

- \triangleright Choose γ_n for fast convergence: Newton method, ...
- Convergence proof: fixed point theorem.

Non-smooth convex optimization

$$\|\cdot\|_1: \left\{ \begin{array}{ccc} \mathbb{R}^2 & \to & \mathbb{R} \\ (x,y) & \mapsto & |x|+|y| \end{array} \right.$$

not differentiable on
$$\{0\}\times\mathbb{R}\cup\mathbb{R}\times\{0\}$$

A pioneer

Jean-Jacques Moreau (1923–2014)

The (Moreau) subdifferential of f, denoted by ∂f ,

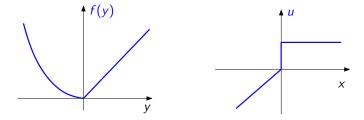

Let $f: \mathcal{H} \to]-\infty, +\infty]$ be a proper function. The (Moreau) subdifferential of f, denoted by ∂f ,

Let $f:\mathcal{H}\to]-\infty,+\infty]$ be a proper function.

$$\partial f: \mathcal{H} \to 2^{\mathcal{H}}$$

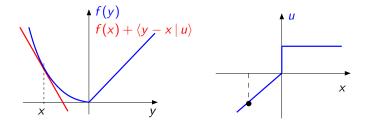

$$x \to \begin{cases} \{u \in \mathcal{H} \mid (\forall y \in \mathcal{H}) \ \langle y - x | u \rangle + f(x) \le f(y) \} \end{cases}$$

Let $f:\mathcal{H}\to]-\infty,+\infty]$ be a proper function.

$$\partial f: \mathcal{H} \to 2^{\mathcal{H}}$$

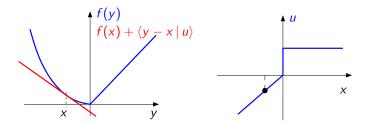

$$x \to \begin{cases} \{u \in \mathcal{H} \mid (\forall y \in \mathcal{H}) \ \langle y - x | u \rangle + f(x) \le f(y) \} \end{cases}$$

Let $f:\mathcal{H}\to]-\infty,+\infty]$ be a proper function.

$$\partial f: \mathcal{H} \to 2^{\mathcal{H}}$$

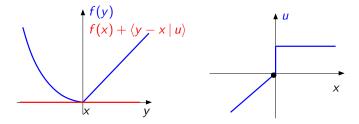

$$x \to \begin{cases} \{u \in \mathcal{H} \mid (\forall y \in \mathcal{H}) \ \langle y - x | u \rangle + f(x) \le f(y) \} \end{cases}$$

Let $f:\mathcal{H}\to]-\infty,+\infty]$ be a proper function.

$$\partial f: \mathcal{H} \to 2^{\mathcal{H}}$$

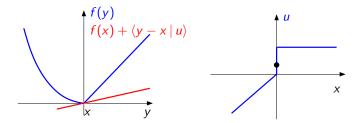

$$x \to \begin{cases} \{u \in \mathcal{H} \mid (\forall y \in \mathcal{H}) \ \langle y - x | u \rangle + f(x) \le f(y) \} \end{cases}$$

Let $f:\mathcal{H}\to]-\infty,+\infty]$ be a proper function.

$$\partial f: \mathcal{H} \to 2^{\mathcal{H}}$$

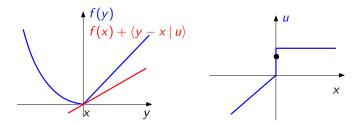

$$x \to \begin{cases} u \in \mathcal{H} \mid (\forall y \in \mathcal{H}) \ \langle y - x | u \rangle + f(x) \le f(y) \end{cases}$$

Let $f: \mathcal{H} \to]-\infty, +\infty]$ be a proper function.

$$\partial f: \mathcal{H} \to 2^{\mathcal{H}}$$

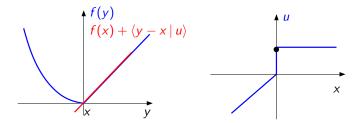

$$x \to \begin{cases} \{u \in \mathcal{H} \mid (\forall y \in \mathcal{H}) \ \langle y - x | u \rangle + f(x) \le f(y) \} \end{cases}$$

Let $f:\mathcal{H}\to]-\infty,+\infty]$ be a proper function.

$$\partial f: \mathcal{H} \to 2^{\mathcal{H}}$$

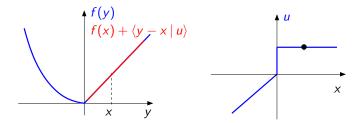

$$x \to \begin{cases} u \in \mathcal{H} \mid (\forall y \in \mathcal{H}) \ \langle y - x | u \rangle + f(x) \leq f(y) \end{cases}$$

Let $f: \mathcal{H} \to]-\infty, +\infty]$ be a proper function.

$$\partial f: \mathcal{H} \to 2^{\mathcal{H}}$$

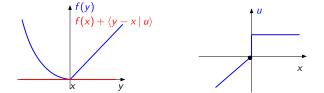

$$x \to \begin{cases} \{u \in \mathcal{H} \mid (\forall y \in \mathcal{H}) \ \langle y - x | u \rangle + f(x) \le f(y) \} \end{cases}$$

Let $f: \mathcal{H} \to]-\infty, +\infty]$ be a proper function.

The (Moreau) subdifferential of f, denoted by ∂f , is such that

$$\partial f: \mathcal{H} \to 2^{\mathcal{H}}$$
$$x \to \{ u \in \mathcal{H} \mid (\forall y \in \mathcal{H}) \ \langle y - x | u \rangle + f(x) \le f(y) \}$$

Fermat's rule : $0 \in \partial f(x) \Leftrightarrow x \in \text{Argmin } f$

Let $f: \mathcal{H} \to]-\infty, +\infty]$ be a proper function.

The (Moreau) subdifferential of f, denoted ∂f , is such that

$$\partial f: \mathcal{H} \to 2^{\mathcal{H}}$$
$$x \to \{ u \in \mathcal{H} \mid (\forall y \in \mathcal{H}) \ \langle y - x | u \rangle + f(x) \le f(y) \}$$

 $u \in \partial f(x)$ is a subgradient of f at x.

If $f:\mathcal{H}\to]-\infty,+\infty]$ is convex and it is Gâteaux differentiable at x, then

$$\partial f(x) = \{\nabla f(x)\}$$

If $f \colon \mathcal{H} \to]-\infty, +\infty]$ is convex and it is Gâteaux differentiable at x, then

$$\partial f(x) = \{\nabla f(x)\}\$$

$$(\forall y \in \mathcal{H}) \qquad \langle \nabla f(x) \mid y \rangle = \lim_{\substack{\alpha \to 0 \\ \alpha \neq 0}} \frac{f(x + \alpha y) - f(x)}{\alpha}.$$

Proof:

For every $\alpha \in [0,1]$ and $y \in \mathcal{H}$,

$$f(x + \alpha(y - x)) \le (1 - \alpha)f(x) + \alpha f(y)$$

$$\Rightarrow \langle \nabla f(x) \mid y - x \rangle = \lim_{\substack{\alpha \to 0 \\ \alpha \neq 0}} \frac{f(x + \alpha(y - x)) - f(x)}{\alpha} \le f(y) - f(x)$$

Then $\nabla f(x) \in \partial f(x)$.

If $f: \mathcal{H} \to]-\infty, +\infty]$ is convex and it is Gâteaux differentiable at x, then

$$\partial f(x) = \{\nabla f(x)\}\$$

$$(\forall y \in \mathcal{H}) \qquad \langle \nabla f(x) \mid y \rangle = \lim_{\substack{\alpha \to 0 \\ \alpha \neq 0}} \frac{f(x + \alpha y) - f(x)}{\alpha}.$$

Proof:

Conversely, if $u \in \partial f(x)$, then, for every $\alpha \in [0, +\infty[$ and $y \in \mathcal{H}$,

$$f(x + \alpha y) \ge f(x) + \langle u \mid x + \alpha y - x \rangle$$

$$\Rightarrow \langle \nabla f(x) \mid y \rangle = \lim_{\substack{\alpha \to 0 \\ \alpha \neq 0}} \frac{f(x + \alpha y) - f(x)}{\alpha} \ge \langle u \mid y \rangle$$

By selecting $y = u - \nabla f(x)$, it results that $||u - \nabla f(x)||^2 \le 0$ and then $u = \nabla f(x)$.

Let $f:\mathcal{H}\to]-\infty,+\infty]$ be Gâteaux differentiable on $\mathrm{dom}\, f$, with $\mathrm{dom}\, f$ a convex subset of $\mathcal{H}.$

Then, f is convex if and only if

$$(\forall (x,y) \in (\operatorname{dom} f)^2) \quad f(y) \geq f(x) + \langle \nabla f(x) \mid y - x \rangle.$$

Let $f:\mathcal{H}\to]-\infty,+\infty]$ be Gâteaux differentiable on $\mathrm{dom}\, f$, with $\mathrm{dom}\, f$ a convex subset of $\mathcal{H}.$

Then, f is convex if and only if

$$(\forall (x,y) \in (\text{dom } f)^2) \quad f(y) \geq f(x) + \langle \nabla f(x) \mid y - x \rangle.$$

Proof:

We have already seen that the gradient inequality holds when f is convex and differentiable at $x \in \mathcal{H}$.

Let $f: \mathcal{H} \to]-\infty, +\infty]$ be Gâteaux differentiable on $\mathrm{dom}\, f$, with $\mathrm{dom}\, f$ a convex subset of $\mathcal{H}.$

Then,
$$f$$
 is convex if and only if

$$(\forall (x,y) \in (\mathrm{dom}\, f)^2) \quad f(y) \geq f(x) + \langle \nabla f(x) \mid y - x \rangle.$$

Proof:

Conversely, if the gradient inequality is satisfied, we have, for every $(x,y) \in (\text{dom } f)^2$ and $\alpha \in [0,1]$, $\alpha x + (1-\alpha)y \in \text{dom } f$, and

$$f(x) \ge f(\alpha x + (1 - \alpha)y) + (1 - \alpha) \langle \nabla f(\alpha x + (1 - \alpha)y) \mid x - y \rangle$$

$$f(y) \ge f(\alpha x + (1 - \alpha)y) + \alpha \langle \nabla f(\alpha x + (1 - \alpha)y) \mid y - x \rangle.$$

By multiplying the first inequality by α and the second one by $1-\alpha$ and summing them, we get

$$\alpha f(x) + (1 - \alpha)f(y) \ge f(\alpha x + (1 - \alpha)y).$$

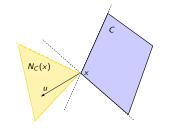

Subdifferential of a convex function: example

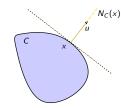

Let C be a nonempty subset of \mathcal{H} with indicator function defined as

$$(\forall x \in \mathcal{H}) \qquad \iota_C(x) = \begin{cases} 0 & \text{if } x \in C \\ +\infty & \text{otherwise.} \end{cases}$$

For every $x \in \mathcal{H}$, $\partial \iota_C(x)$ is the normal cone to C at x defined by

$$N_C(x) = \begin{cases} \left\{ u \in \mathcal{H} \mid (\forall y \in C) \ \langle u \mid y - x \rangle \leq 0 \right\} & \text{if } x \in C \\ \emptyset & \text{otherwise.} \end{cases}$$

Subdifferential calculus

Let ${\mathcal H}$ and ${\mathcal G}$ be two real Hilbert spaces.

- ▶ Let $f: \mathcal{H} \to]-\infty, +\infty]$ be proper, then $\forall \lambda \in]0, +\infty[\partial(\lambda f) = \lambda \partial f.$
- ▶ Let $f: \mathcal{H} \to]-\infty, +\infty]$, $g: \mathcal{G} \to]-\infty, +\infty]$, and $L \in \mathcal{B}(\mathcal{H}, \mathcal{G})$.

Define $g \circ L(x) := g(Lx)$ and L^* the adjoint operator of L:

$$(\forall (x,y) \in \mathcal{H} \times \mathcal{G}) \quad \langle y \mid Lx \rangle = \langle L^*y \mid x \rangle.$$

If $dom g \cap L(dom f) \neq \emptyset$, then

$$(\forall x \in \mathcal{H}) \qquad \partial f(x) + L^* \partial g(Lx) \subset \partial (f + g \circ L)(x).$$

Subdifferential calculus

Let ${\mathcal H}$ and ${\mathcal G}$ be two real Hilbert spaces.

- ▶ Let $f: \mathcal{H} \to]-\infty, +\infty]$ be proper, then $\forall \lambda \in]0, +\infty[\partial(\lambda f) = \lambda \partial f$.
- ▶ Let $f: \mathcal{H} \to]-\infty, +\infty]$, $g: \mathcal{G} \to]-\infty, +\infty]$, and $L \in \mathcal{B}(\mathcal{H}, \mathcal{G})$.

Define $g \circ L(x) := g(Lx)$ and L^* the adjoint operator of L:

$$(\forall (x,y) \in \mathcal{H} \times \mathcal{G}) \quad \langle y \mid Lx \rangle = \langle L^*y \mid x \rangle.$$

If dom $g \cap L(\text{dom } f) \neq \emptyset$, then

$$(\forall x \in \mathcal{H}) \qquad \partial f(x) + L^* \partial g(Lx) \subset \partial (f + g \circ L)(x).$$

<u>Proof</u>: Let $x \in \mathcal{H}$, $u \in \partial f(x)$ and $v \in \partial g(Lx)$. We have:

$$u + L^*v \in \partial f(x) + L^*\partial g(Lx)$$
 and

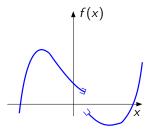

$$(\forall y \in \mathcal{H}) \qquad f(y) \ge f(x) + \langle y - x \mid u \rangle$$
$$g(Ly) \ge g(Lx) + \langle L(y - x) \mid v \rangle.$$

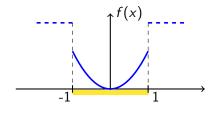

Therefore, by summing,

$$f(y) + g(Ly) > f(x) + g(Lx) + \langle y - x \mid u + L^*v \rangle.$$

We deduce that $u + L^*v \in \partial (f + g \circ L)(x)$.

Subdifferential: the case of discontinuous functions

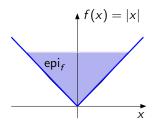

Epigraph

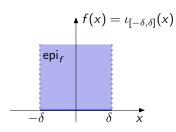

Let $f:\mathcal{H}\to]-\infty,+\infty].$ The epigraph of f is

$$\operatorname{\mathsf{epi}} f = \big\{ \big(x, \zeta \big) \in \operatorname{\mathsf{dom}} f \times \mathbb{R} \,\, \big| \,\, f(x) \leq \zeta \big\}$$

Epigraph

Let $f:\mathcal{H}\to]-\infty,+\infty]$. The epigraph of f is $\operatorname{\sf epi} f=\big\{(x,\zeta)\in\operatorname{dom} f\times\mathbb{R}\ \big|\ f(x)\leq\zeta\big\}$

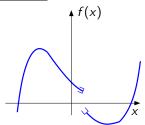

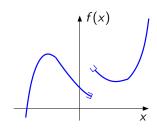

Lower semi-continuity

Let $f: \mathcal{H} \to]-\infty, +\infty]$.

f is a lower semi-continuous function on $\mathcal H$ if and only if $\operatorname{epi} f$ is closed

I.s.c. functions ?

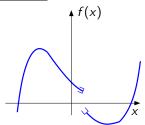

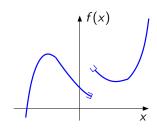

Lower semi-continuity

Let $f: \mathcal{H} \to]-\infty, +\infty]$.

f is a lower semi-continuous function on $\mathcal H$ if and only if $\operatorname{epi} f$ is closed

I.s.c. functions ?

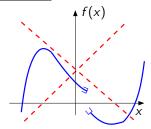

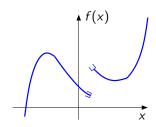

Let $f: \mathcal{H} \to]-\infty, +\infty]$.

f is a lower semi-continuous function on $\mathcal H$ if and only if epi f is closed

► <u>l.s.c. functions</u> ?

Let $f: \mathcal{H} \to]-\infty, +\infty]$.

f is a lower semi-continuous function on ${\mathcal H}$ if and only if $\operatorname{\sf epi} f$ is closed

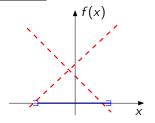

I.s.c. functions ?

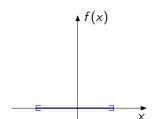

Let $f: \mathcal{H} \to]-\infty, +\infty]$.

f is a lower semi-continuous function on $\mathcal H$ if and only if $\operatorname{\sf epi} f$ is closed

I.s.c. functions ?

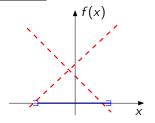

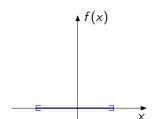

Let $f: \mathcal{H} \to]-\infty, +\infty]$.

f is a lower semi-continuous function on $\mathcal H$ if and only if $\operatorname{\sf epi} f$ is closed

I.s.c. functions ?

- \blacktriangleright Every continuous function on $\mathcal H$ is l.s.c.
- ► Every finite sum of l.s.c. functions is l.s.c.
- Let $(f_i)_{i \in I}$ be a family of l.s.c functions. Then, $\sup_{i \in I} f_i$ is l.s.c.

A class of convex functions

- ▶ $\Gamma_0(\mathcal{H})$: class of convex, l.s.c., and proper functions from \mathcal{H} to $]-\infty, +\infty].$
- ι _C ∈ Γ₀(\mathcal{H}) \Leftrightarrow C is a nonempty closed convex set.

$$\underline{\mathsf{Proof}} \colon \operatorname{\mathsf{epi}}_{\iota_{\mathsf{C}}} = \mathsf{C} \times [0, +\infty[.$$

Let \mathcal{H} and \mathcal{G} be two real Hilbert spaces.

Let $f \in \Gamma_0(\mathcal{H})$, $g \in \Gamma_0(\mathcal{G})$, and $L \in \mathcal{B}(\mathcal{H}, \mathcal{G})$.

If $\operatorname{int} (\operatorname{dom} g) \cap L(\operatorname{dom} f) \neq \emptyset$ or $\operatorname{dom} g \cap \operatorname{int} (L(\operatorname{dom} f)) \neq \emptyset$, then

$$\partial f + L^* \partial g L = \partial (f + g \circ L)$$
.

Particular case:

- ▶ If $f \in \Gamma_0(\mathcal{H})$, $g \in \Gamma_0(\mathcal{G})$, and f is finite valued, then $\partial f + \partial g = \partial (f + g)$.
- ▶ If $g \in \Gamma_0(\mathcal{G})$, $L \in \mathcal{B}(\mathcal{G}, \mathcal{H})$, and $\operatorname{int} (\operatorname{dom} g) \cap \operatorname{ran} L \neq \emptyset$, then $L^* \partial g L = \partial (g \circ L)$.

Let $(\mathcal{H})_{i\in I}$ where $I\subset\mathbb{N}$ be Hilbert spaces and let $\mathcal{H}=\bigoplus_{i\in I}\mathcal{H}_i$. For every $i\in I$, let $f_i\colon\mathcal{H}_i\to]-\infty,+\infty$] be a proper function. Let

$$f: \mathcal{H} \to]-\infty, +\infty]: x = (x_i)_{i \in I} \mapsto \sum_{i \in I} f_i(x_i)$$

Then,

$$(\forall x = (x_i)_{i \in I} \in \mathcal{H})$$
 $\partial f(x) = \underset{i \in I}{\times} \partial f_i(x_i).$

Let $(\mathcal{H})_{i\in I}$ where $I\subset\mathbb{N}$ be Hilbert spaces and let $\mathcal{H}=\bigoplus_{i\in I}\mathcal{H}_i$. For every $i\in I$, let $f_i\colon\mathcal{H}_i\to]-\infty,+\infty]$ be a proper function. Let

$$f: \mathcal{H} \to]-\infty, +\infty]: x = (x_i)_{i \in I} \mapsto \sum_{i \in I} f_i(x_i)$$

Then,

$$(\forall x = (x_i)_{i \in I} \in \mathcal{H})$$
 $\partial f(x) = \underset{i \in I}{\times} \partial f_i(x_i).$

<u>Proof</u>: Let $x = (x_i)_{i \in I} \in \mathcal{H}$. We have

$$t = (t_i)_{i \in I} \in \underset{i \in I}{\times} \partial f_i(x_i)$$

$$\Leftrightarrow (\forall i \in I)(\forall y_i \in \mathcal{H}_i) \ f_i(y_i) \ge f_i(x_i) + \langle t_i \mid y_i - x_i \rangle$$

$$\Rightarrow (\forall y = (y_i)_{i \in I} \in \mathcal{H}) \quad \sum_{i \in I} f_i(y_i) \ge \sum_{i \in I} f_i(x_i) + \sum_{i \in I} \langle t_i \mid y_i - x_i \rangle$$

$$\Leftrightarrow (\forall y \in \mathcal{H}) \ f(y) \geq f(x) + \langle t \mid y - x \rangle.$$

Let $(\mathcal{H})_{i\in I}$ where $I\subset\mathbb{N}$ be Hilbert spaces and let $\mathcal{H}=\bigoplus_{i\in I}\mathcal{H}_i$. For every $i\in I$, let $f_i\colon\mathcal{H}_i\to]-\infty,+\infty]$ be a proper function. Let

$$f: \mathcal{H} \to]-\infty, +\infty]: x = (x_i)_{i \in I} \mapsto \sum_{i \in I} f_i(x_i)$$

Then,

$$(\forall x = (x_i)_{i \in I} \in \mathcal{H})$$
 $\partial f(x) = \underset{i \in I}{\times} \partial f_i(x_i).$

Proof: Conversely,

$$t = (t_i)_{i \in I} \in \partial f(x)$$

$$\Leftrightarrow (\forall y = (y_i)_{i \in I} \in \mathcal{H}) \sum_{i \in I} f_i(y_i) \ge \sum_{i \in I} f_i(x_i) + \sum_{i \in I} \langle t_i \mid y_i - x_i \rangle.$$

Let $j \in I$. By setting $(\forall i \in I \setminus \{j\})$ $y_i = x_i \in \text{dom } f_i$, we get

$$(\forall y_j \in \mathcal{H}_j) \ f_j(y_j) \geq f_j(x_j) + \langle t_j \mid y_j - x_j \rangle.$$

Exercise 1: Huber function

Let $\rho > 0$ and set

$$f: \mathbb{R} \to \mathbb{R}: \mapsto \begin{cases} \frac{x^2}{2}, & \text{if } |x| \le \rho \\ \rho |x| - \frac{\rho^2}{2}, & \text{otherwise.} \end{cases}$$

- 1. What is the domain of f?
- 2. Plot the subdifferential of f.
- 3. Is f differentiable? Prove that f is convex.

Exercise 2

Let \mathcal{H} be a Hilbert space. Let $f: \mathcal{H} \to]-\infty, +\infty]$ and let $\mathcal{C} \subset \mathcal{H}$ such that $\mathrm{dom}\, f \cap \mathcal{C} \neq \emptyset$. Give a sufficient condition for $x \in \mathcal{H}$ to be a global minimizer of $f + \iota_{\mathcal{C}}$.

Exercice 3: Monotony of the subdifferential of a function

Let $f: \mathcal{H} \to]-\infty, +\infty]$ be a proper function.

Its subdifferential is a monotone operator, i.e.

$$\big(\forall (x_1,x_2)\in \mathcal{H}^2\big)\big(\forall u_1\in \partial f(x_1)\big)\big(\forall u_2\in \partial f(x_2)\big)\ \langle u_1-u_2\mid x_1-x_2\rangle\geq 0.$$

Exercice 3: Monotony of the subdifferential of a function

Let $f: \mathcal{H} \to]-\infty, +\infty]$ be a proper function.

Its subdifferential is a monotone operator, i.e.

$$(\forall (x_1,x_2) \in \mathcal{H}^2) (\forall u_1 \in \partial f(x_1)) (\forall u_2 \in \partial f(x_2)) \quad \langle u_1 - u_2 \mid x_1 - x_2 \rangle \geq 0.$$

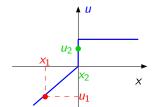

Proof:

By definition:

$$\langle x_2-x_1|u_1\rangle+f(x_1)\leq f(x_2)$$

$$\langle x_1 - x_2 | u_2 \rangle + f(x_2) \leq f(x_1)$$

lt results that $\langle x_1 - x_2 | u_1 - u_2 \rangle \ge 0$.

Exercice 4: Convexity and monotony

Let $f:\mathcal{H}\to]-\infty,+\infty]$ be Gâteaux differentiable on $\mathrm{dom}\,f$, which is convex.

Then, f is convex if and only if ∇f is monotone on $\operatorname{dom} f$, i.e.

$$(\forall (x,y) \in (\text{dom } f)^2) \quad \langle \nabla f(y) - \nabla f(x) \mid y - x \rangle \ge 0.$$

Exercice 4: Convexity and monotony

Let $f:\mathcal{H}\to]-\infty,+\infty]$ be Gâteaux differentiable on $\mathrm{dom}\,f$, which is convex.

Then, f is convex if and only if ∇f is monotone on $\operatorname{dom} f$, i.e.

$$(\forall (x,y) \in (\text{dom } f)^2) \quad \langle \nabla f(y) - \nabla f(x) \mid y - x \rangle \ge 0.$$

Proof:

When f is convex, we have seen that its subdifferential is monotone and, for every $x \in \text{dom } f$, $\partial f(x) = {\nabla f(x)}$.

Exercice 4: Convexity and monotony

Let $f\colon \mathcal{H}\to \left]-\infty,+\infty\right]$ be Gâteaux differentiable on $\mathrm{dom}\,f$, which is convex.

Then, f is convex if and only if ∇f is monotone on $\operatorname{dom} f$, i.e.

$$(\forall (x,y) \in (\text{dom } f)^2) \quad \langle \nabla f(y) - \nabla f(x) \mid y - x \rangle \ge 0.$$

Proof:

Conversely, assume that ∇f is monotone on $\operatorname{dom} f$. For every $(x,y) \in (\operatorname{dom} f)^2$, let $\varphi \colon [0,1] \to \mathbb{R} \colon \alpha \mapsto f(x+\alpha(y-x))$. φ is differentiable on [0,1] and

$$(\forall \alpha \in [0,1])$$
 $\varphi'(\alpha) = \langle \nabla f(x + \alpha(y - x)) \mid y - x \rangle.$

On the other hand, for every $\alpha \in]0,1]$

$$\langle \nabla f(x + \alpha(y - x)) - \nabla f(x) \mid y - x \rangle \ge 0$$

$$\Leftrightarrow \varphi'(\alpha) \ge \langle \nabla f(x) \mid y - x \rangle$$

$$\Rightarrow \varphi(1) - \varphi(0) = \int_0^1 \varphi'(\alpha) d\alpha \ge \langle \nabla f(x) \mid y - x \rangle$$

$$\Leftrightarrow f(y) - f(x) \ge \langle \nabla f(x) \mid y - x \rangle.$$
